

Common Problems in Pediatric Anesthesia

This text includes 75 chapters divided into three sections - procedures in neonates, infants and children. Each contributor provides the practitioner and student of anaesthesiology practical suggestions for managing children with a variety of physical conditions during surgical procedure. Emphasis is placed on safe approaches to problems encountered by paediatric anaesthesiologists as well as those who only rarely care for children. New topics include postoperative pain management, liver and bone marrow transplantation, and magnetic resonance imaging (MRI). Discussions of regional anaesthesia and cardiac surgery are expanded. Chapters include line drawings, photos and charts.
